LEXON

Lexon Workspace Complete System Guide

Workspace, Team, YouTube + Instagram automation, Office, login, SQL, Windows + web. Hinglish. Version 4.

Is guide me kya hai	Section
Poora system ek nazar me	1
Package me kya kya hai	2
Setup step by step (sahi order)	3
Login: Google + password, ek owner email	4
Workspace aur Team	5
YouTube automation	6
Instagram automation	7
Office (bina password, central API key)	8
3 SQL files: kaun si, kab, kahan	9
Data kahan rahega	10
Windows .exe + website	11
Suraksha	12
Kya test hua, kya nahi (seedhi baat)	13
Troubleshooting	14

Seedhi baat: Code type-check, build aur local tests se jaancha gaya hai. Lekin aapke asli Supabase projects, Meta app, Google OAuth aur Windows build is sandbox me nahi chal sakte, isliye wo pehli baar aapke setup par hi verify honge. Section 13 me exact list hai.

1. Poora system ek nazar me

Ek hi **website** aur ek hi **Windows .exe** (dono ek hi Workspace app). Login ke baad usi me Team, Office, YouTube aur Instagram sab milta hai.

Hissa	Kya hai	Kahan chalta hai
Lexon Workspace app	Home, Messages, Projects, Tasks, Files, Team, Activity, Analytics, Automations, Integrations, Agents, Office, Settings	Website + Windows .exe (same code)
Project A (Supabase)	Workspace + Team ka database, login, files, API keys (Vault), Edge Functions	Supabase cloud, 1 SQL
Project E (Supabase)	YouTube + Instagram ka ek hi database aur functions	Supabase cloud, 1 SQL
Office server	3D office, workers, SQLite. Apna login nahi	Aapka server / VPS (Node)

Rasta: Browser/.exe → Project A (login, permission) → project-gateway → Project E (service key sirf Vault me). Office: Workspace → office-sso → Office server (token 12 ghante). Browser ke paas kabhi service key ya AI key nahi jaati.

2. Package me kya kya hai

Path	Kaam
lexon-workspace/apps/web	Website (React + Vite)
lexon-workspace/apps/desktop	Windows app (Electron)
lexon-workspace/supabase/LEXON_A_workspace_team.sql	SQL 1: Workspace + Team + owner email
lexon-workspace/supabase/automation/LEXON_CD_automation.sql	SQL 2: YouTube + Instagram (ek database)
lexon-workspace/supabase/automation/functions	Project E ke Edge Functions
lexon-workspace/supabase/functions	Project A ke Edge Functions (office-sso, office-ai, project-gateway, ...)
office/	Office server + prebuilt web + database/LEXON_B_office.sql (SQL 3, optional)
lexon-workspace/docs	Ye PDF + md guides

3. Setup step by step (is order me)

Step 1: Project A

1. supabase.com par naya project banao (A).
2. SQL Editor me **LEXON_A_workspace_team.sql** kholo. Sabse neeche (search: **<<<**) apna **owner email** likho. Password SQL me dena chaho to v_password me 8+ character likho, warna khali chhodo.
3. Run karo (ek baar).
4. Authentication → Providers: Google ON (Client ID/Secret). URL Configuration: Site URL = website ka URL; Redirect URLs me website ka URL aur lexon://app jodo.
5. Authentication → Sign In: public sign-ups band rakho (gate DB me bhi hai).

Step 2: Project A functions

```
supabase link --project-ref <A-ref>
cp supabase/.env.example supabase/.env   # values bharo
supabase secrets set --env-file supabase/.env
supabase functions deploy
```

Zaroori secrets: ALLOWED_ORIGINS (website + lexon://app), APP_URL, OAUTH_STATE_SECRET, GOOGLE_CLIENT_ID/SECRET, OFFICE_GATEWAY_SECRET.

Step 3: Website

```
cd apps/web && cp .env.example .env   # VITE_SUPABASE_URL, VITE_SUPABASE_ANON_KEY
npm install && npm run build            # dist/ ko host karo (deploy.yml GitHub Pages ke liye ready)
```

Step 4: Project E (YouTube + Instagram)

1. Naya Supabase project (E). SQL Editor me **LEXON_CD_automation.sql** run karo.
2. Functions deploy: mkdir e && cp -r supabase/automation e/supabase && cd e && supabase functions deploy --project-ref <E-ref>
3. Secrets: supabase secrets set --env-file supabase/.env (supabase/automation/.env.example se): STATE_SECRET, WORKSPACE_URL, META_*, GOOGLE_*, GEMINI_API_KEY.
4. Workspace → Integrations → Lexon Workspace → Automation backend → Link: E ka URL + service_role key. Phir Test connection.
5. AUTOMATION_PREFLIGHT.sql E me chala kar sab rows ok check karo.

Step 5: Office server

1. Office folder kisi server par rakho: npm install && npm run server (ya docker compose up), HTTPS ke saath.
2. Env: OFFICE_SSO_SECRET (24+ chars), OFFICE_GATEWAY_SECRET (A wale jaisa), WORKSPACE_FUNCTIONS_URL, OFFICE_FRAME_ANCESTORS.
3. Workspace → Integrations → Lexon Office → Link Office: URL + wahi SSO secret.
4. Wahin "AI models and APIs" me keys daalo. Office khud utha leta hai (5 minute me).

Step 6: Windows .exe

GitHub → Actions → "Build Windows app (.exe)" → Run. Secrets: VITE_SUPABASE_URL, VITE_SUPABASE_ANON_KEY. Installer artifact me milta hai.

4. Login: Google + password, ek owner email

- **Teen tareeke:** Google, email + password (8+ char), email code. Teeno par same allow-list.
- **Ek owner email:** SQL me app_owner. Naya workspace ka pehla account sirf wahi email ban sakta hai. Koi aur Gmail pehle account nahi bana sakta.
- **Baaki log:** Owner Team page se invite karta hai (authorized_emails). Invite ke bina login reject.
- **Password:** SQL ka optional block ya Supabase Dashboard → Users → Add user (Auto confirm). Password sirf bcrypt hash me store hota hai, plain text kahin nahi.
- **Office me alag password nahi.** Workspace login hi sab kuch kholta hai.

SQL file me jo password aap likhoge wo file me plain text rahega jab tak aap use hata na do. Run karne ke baad file se password mita do ya sirf Dashboard se user banao.

5. Workspace aur Team

Team ab alag app nahi hai: Workspace ke andar hi hai. Roles: Owner/Admin sab dekhte hain aur manage karte hain; Team Member ko fixed set milta hai (Home, Messages, Office, Projects, Tasks,

Activity, Files, Settings). Messages (chat, groups, files, calls), Projects, Tasks, Files, Analytics, Agents, notifications bell, attendance (member profile), dark/light theme, 2FA, idle logout sab isi ek app me hain.

Workspace + Team ek hi Supabase (A) aur ek hi SQL. Alag lexon-team app v2 me bhi diya gaya tha; naye setup me uski zarurat nahi.

6. YouTube automation

- Workspace → Automations → YouTube. Google account connect (youtube.readonly + yt-analytics.readonly). Refresh token E ke Vault me.
- Sync: channel snapshot, 300 tak videos, views/likes/comments; Analytics se watch time, retention, shares, CTR (jo API de).
- AI Studio: ideas, hooks, titles, script, SEO, plan, research. Gemini key E ke secret GEMINI_API_KEY me.
- Jo number API na de, wo dikhaya nahi jata (nakli nahi).

YouTube functions maine UI ke contract se likhe hain, aapke purane YouTube project ka asli code mere paas nahi tha. Pehle sync par errors aa sakte hain; "Notes" me dikhenge.

7. Instagram automation

Aapke Lexon Automation ka engine Edge Functions me port kiya gaya hai. Flow: Meta webhook → ig-webhook (signature check) → active automations → keyword match → comment reply + DM.

Cheez	Detail
Trigger	keywords (exact/flexible) ya any comment; excluded keywords; emoji/short comment option
Post	specific (ek post) ya any (har post)
Delay	1-30 second
Reply	random comment reply + DM (button ke saath)
Stats	triggered, replies, DMs, clicks
Token	60 din ka; Vault me; weekly refresh_tokens schedule

- **Bug fix:** original me duplicate-event check kabhi match nahi karta tha (Meta retry par double DM). Ab har comment par unique claim hota hai.
- **Loop guard:** apne hi reply par automation dobara nahi chalti.
- **Meta:** comments/messages permission ke liye App Review chahiye. Review se pehle sirf test users par chalega.
- Connect ke baad browser web URL par wapas aata hai (WORKSPACE_URL); .exe se connect karo to phir bhi website par wapas aayega, app me wapas jaakar refresh karo.

8. Office

- Office me password / user management / AI-Model section **hata diya**.
- Workspace login ke baad Office page me iframe khulta hai (SSO). Role: owner→owner, admin/manager/member→admin, agent→viewer.
- AI key sirf Workspace → Integrations → Lexon Office. Office server unhe khud pull karta hai.
- Office ka data SQLite me. SQL 3 (LEXON_B_office.sql) optional Supabase mirror hai.
- Office ka alag mobile page (/m) band kar diya (usme password login tha).

Limitation: Workspace ka custom auth-header wala API Office me normal Bearer se jata hai. Gemini, OpenAI, Anthropic aur OpenAI-compatible (Groq, OpenRouter) theek chalenge.

9. Teen SQL files

File	Kahan run	Kya
LEXON_A_workspace_team.sql	Project A	Workspace + Team + roles + RLS + chat/calls + integrations + owner email (0001-0011)
LEXON_CD_automation.sql	Project E	YouTube + Instagram: 14 tables, Vault helpers, RLS, no client access
LEXON_B_office.sql	Office ka alag Supabase (optional)	Office tables + RLS

Extra: DIAGNOSE.sql (A me), AUTOMATION_PREFLIGHT.sql (E me, read-only check).

10. Data kahan rahega

Data	Jagah
Users, profiles, roles, chats, tasks, files, projects	Project A
Google/GitHub tokens, AI keys, Office SSO secret, E ki service key	Project A Vault (encrypted)
YouTube videos/analytics/AI outputs	Project E tables
Instagram accounts, automations, events, stats	Project E tables
Instagram + Google refresh tokens	Project E Vault
Office people/tasks/chat	Office server SQLite
Office AI keys	Office memory/encrypted pool; source of truth Workspace

11. Windows .exe + website

- Dono ek hi code. Har entry par login zaroori (RequireAuth + DB gate); bypass nahi.
- Desktop: lexon:// scheme, sandbox, CSP. Office/YouTube/Instagram iframe/https ke liye frame-src khula hai.
- Voice (Office) ke liye microphone permission aur HTTPS chahiye.

12. Suraksha

- Service key, AI key, SSO secret browser me kabhi nahi; Vault me.
- E ke tables par RLS on, koi client policy nahi, anon/authenticated ke privileges revoke.
- Webhook HMAC-SHA256 se verify; OAuth state signed + expiry.
- Office token 12 ghante; secret compare constant-time.

13. Kya test hua, kya nahi

Cheez	Status
Web + Office TypeScript check, builds	Hua (tsc, vite, next)

Cheez	Status
SQL syntax (A, E, Office, 0011)	Hua (Postgres parser). Asli Supabase par run nahi kiya
Office server: SSO, login band, key sync, 401 checks	Hua (local, fake Workspace)
Office UI me AI manager gayab, settings me login nahi	Hua (browser test)
Keyword matching rules	Hua (unit asserts)
Edge Functions (A aur E) type-check	Hua. Deno par chalaye nahi
Workspace pages (Office link, Instagram, Activity)	Demo mode me render check. Asli backend ke saath nahi
Google login, Meta OAuth/webhook/DM, YouTube APIs	**Nahi hua**: aapke accounts chahiye
Windows .exe build	**Nahi hua**: GitHub Actions par chalega
Owner password SQL block	**Nahi hua**: Supabase version par depend, fail ho to Dashboard se user banao

14. Troubleshooting

Dikkat	Hal
Login "Email not authorized"	Email owner/invite list me nahi. app_owner ya Team → Invite check karo
"Owner email not set"	0011 me CHANGE_ME@gmail.com badla nahi
Office khulta nahi	Link Office dobara, SSO secret dono jagah same, OFFICE_FRAME_ANCESTORS = website URL
Office me AI nahi	Workspace me key add ki? Office server ke logs me "AI key sync failed"; OFFICE_GATEWAY_SECRET match
Instagram connect fail	META_REDIRECT_URI Meta app me bilkul same; app test user
Webhook 401	META_APP_SECRET galat
YouTube "refresh token nahi mila"	myaccount.google.com/permissions se app hata kar dobara connect
